

Airflow Orchestration Guide

Synthetic sample knowledge-base document for local RAG testing

Overview

A sample guide to DAGs, tasks, scheduling, dependencies, retries, and monitoring.

Key Information

1. A DAG defines a workflow as tasks and dependencies without containing cycles.
2. Task dependencies determine execution order.
3. Retries can automatically rerun transiently failed tasks according to configured limits.
4. Operational monitoring should include task duration, failure rate, retries, and missed schedules.

RAG Test Notes

This document is intentionally concise and contains distinctive terms so that semantic retrieval can identify it when a user asks a related question. It is sample content and should not be treated as professional, legal, medical, financial, or regulatory advice.
