

Apache Spark Fundamentals

Synthetic sample knowledge-base document for local RAG testing

Overview

Spark concepts including DataFrames, transformations, actions, partitioning, and caching.

Key Information

1. Spark transformations describe how a dataset should be changed and are generally evaluated lazily.
2. Actions trigger execution and produce a result or write data.
3. Partitioning affects how work is distributed across executors.
4. Caching can reduce repeated computation when the same dataset is reused and fits the workload.

RAG Test Notes

This document is intentionally concise and contains distinctive terms so that semantic retrieval can identify it when a user asks a related question. It is sample content and should not be treated as professional, legal, medical, financial, or regulatory advice.
