

SQL Query Guide

Synthetic sample knowledge-base document for local RAG testing

Overview

A sample SQL reference covering filtering, joins, aggregation, grouping, and window functions.

Key Information

1. An inner join returns rows with matching keys on both sides of the join condition.
2. A left join keeps every row from the left table and adds matching values from the right table.
3. GROUP BY creates groups over which aggregate functions such as SUM or COUNT can operate.
4. Window functions calculate values across related rows without collapsing the result into one row per group.

RAG Test Notes

This document is intentionally concise and contains distinctive terms so that semantic retrieval can identify it when a user asks a related question. It is sample content and should not be treated as professional, legal, medical, financial, or regulatory advice.
