

Vector Embeddings Guide

Synthetic sample knowledge-base document for local RAG testing

Overview

Sample explanation of embeddings, cosine similarity, vector search, and semantic retrieval.

Key Information

1. An embedding maps text into a numerical vector space.
2. Semantically similar text tends to have vectors that are closer according to the chosen similarity measure.
3. Cosine similarity compares the angle between two vectors and is commonly used for text embeddings.
4. Embedding models should be selected and evaluated for the language and domain of the source content.

RAG Test Notes

This document is intentionally concise and contains distinctive terms so that semantic retrieval can identify it when a user asks a related question. It is sample content and should not be treated as professional, legal, medical, financial, or regulatory advice.
